

The impact of teacher race on student performance on the End-of-Course Algebra I STAAR

Wish this weren't a
sunburnt white man...

INTRODUCTION

Algebra I is the most failed class in the country. As the foundational course to all secondary and higher-level mathematics and sciences, lack of mastery of Algebra can then be the indicator for lack of future involvement and/or achievement in STEM fields. As a former BIPOC teacher of BIPOC students, I sought out to determine if teacher race had any impact on predicting student performance on the Texas Algebra I STAAR.

The concept of racial hierarchy of mathematical ability—a term coined by Danny Martin, education professor at the University of Illinois at Chicago—basically says constantly reading and hearing about underperforming black, Latino, and indigenous students begins to embed itself into how math teachers view these students, attributing achievement differences to their innate ability to succeed in math.

— THE ATLANTIC, “*How Does Race Affect a Student’s Math Education?*” (April 2017)

PROJECT GOALS

- 1) To create a web scraper and parser to scrape data from the Texas Education Agency for every campus in Texas
- 2) To predict the percentage of students of marginalized demographic on any given Texas public school campus who will score MASTERS on the End-of-Course Algebra I STAAR based on the percentage of BIPOC teachers they've been exposed to

MACHINE LEARNING

PROCESS

$$\begin{cases} x = \frac{1}{1+y} \\ x = y + 3 \end{cases}$$

Step 1

Web scraping + parsing two pages per school; merge dataframes, clean + cast data into usable form

$$x = \frac{1}{1+y}$$

Step 2

EDA!

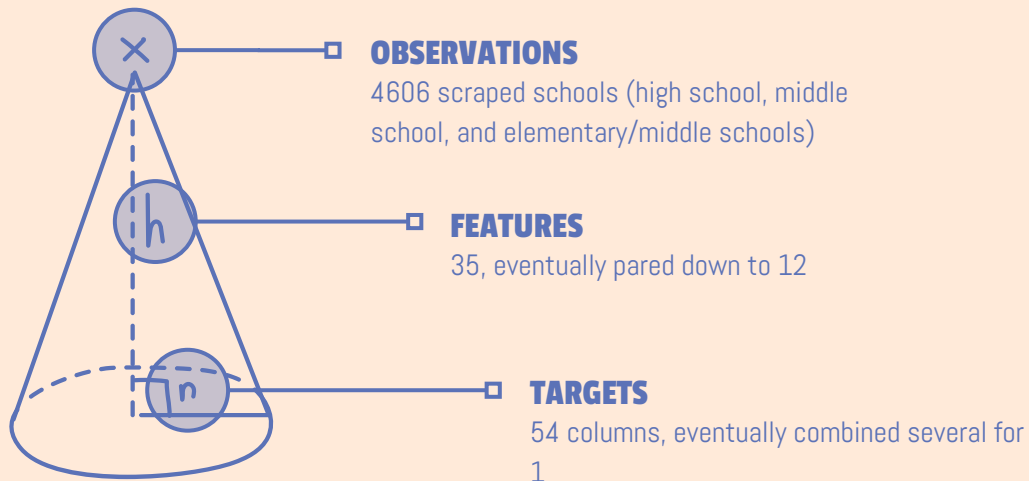

$$y + 3 = \frac{1}{1+y}$$

Step 3

Modeling, then rinse and repeat

62	BIPOC_Masters_no_Asian	127	non-null	float64
63	Difference_White_BIPOC_Masters_no_Asian	127	non-null	float64
64	BIPOC_Campus	127	non-null	float64

In the current iteration of the End-of-Course Algebra I STAAR, students can score in one of four ways:

Approaching grade level (roughly 38% correct)

Meets grade level (roughly 55% correct)

Masters grade level (roughly 73% correct)

```
1 total_df['BIPOC_Masters'] = total_df[['African_American_Masters', 'Hispanic_Masters',
2   'American_Indian_Masters', 'Asian_Masters', 'Pacific_Islander_Masters',
3   'Two_or_More_Races_Masters']].mean(axis=1)
4 total_df['Difference_White_BIPOC_Masters'] = total_df['White_Masters'] - total_df['BIPOC_Masters']
```

Ultimately created a new target column based on a combination of others that represents the difference between the percent of white students that score masters and the average of BIPOC students that score masters.

EDA

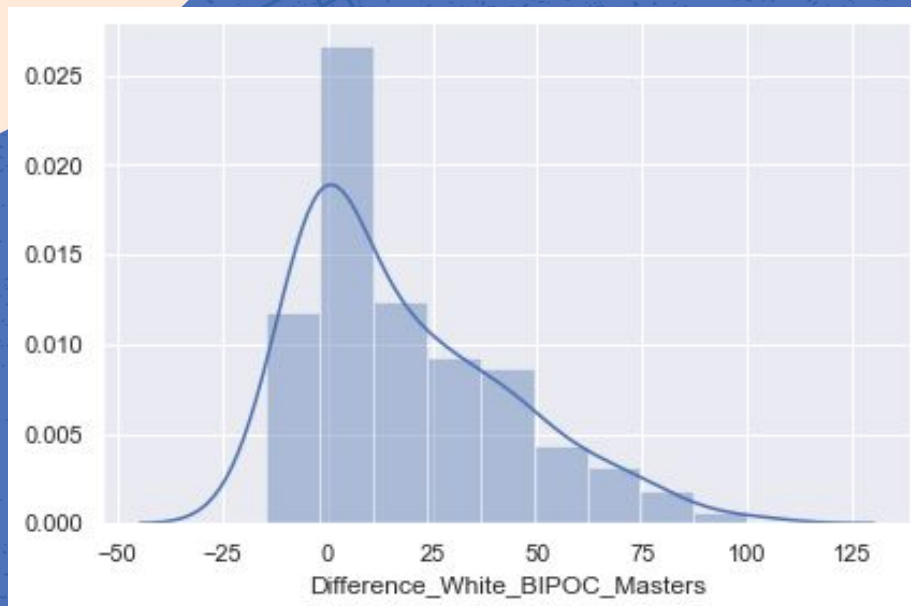

18.5%

mean

-14.5%, 100%

minimum, maximum

MODEL: LINEAR REGRESSION

RMSE = 16.05

RANDOM FOREST

2³

FUTURE STEPS

Do some feature engineering to make the features less numeric

Is there any data on teacher demographics by subject?

Drop outliers/observations with negative target values

Deeper EDA on total_df, including investigating loss of certain data points

THANKS FOR SWINGING BY!

Does anyone have any questions?
